

# Using Roundup PROMAX® for Control of Winter Weeds and Tall Fescue in Dormant Bermudagrass and Bahiagrass Turf

Winter grassy and broadleaf weeds begin emerging in late winter and early spring. By late spring they are producing and releasing seed that will germinate in the turf the following year. Controlling winter weeds early in the season can diminish weed seeds for the next year. Winter weed control also removes competition which can delay spring green-up. This guide offers useful strategies to consider when using Roundup PROMAX herbicide for the control of winter weeds in dormant bermudagrass and bahiagrass turf.

## The Most Powerful PRO Ever

### How to Control Winter Weeds and Tall Fescue in Dormant Bermudagrass and Bahiagrass Turf

- Roundup PROMAX may be used to control or suppress many winter annual weeds and tall fescue for effective release of dormant bermudagrass and bahiagrass turf. Treat only when turf is dormant and prior to spring green-up and winter annual weeds and/or tall fescue are actively growing.
- For best results on winter annuals, use Roundup PROMAX to treat when plants are in an early growth stage (below 6 inches in height) after most have germinated and actively growing. For best results on tall fescue, treat when fescue is actively growing and at or beyond the 4- to 6-leaf stage.
- Apply 5 to 44 fluid ounces of Roundup PROMAX per acre. Apply the recommended rates in 10 to 40 gallons of water per acre. Use only in areas where bermudagrass or bahiagrass are desirable ground covers and where some temporary injury or discoloration can be tolerated.
- Treatments in excess of 11 fluid ounces per acre may result in injury or delayed green-up in highly maintained areas, such as golf courses and lawns. DO NOT apply tank mixtures of Roundup PROMAX plus Oust® in highly maintained turfgrass areas.
